

DRUG ANTIBIOTICS

PHARYNGITIS-TONSILLITIS IN CHILDREN AND ADULTS

This optimal usage guide is mainly intended for primary care health professionnals. It is provided for information purposes only and should not replace the clinician's judgement. The recommendations were developed using a systematic approach and are supported by the scientific literature and the knowledge and experience of Quebec clinicians and experts. For more details, go to inesss.qc.ca.

GENERAL INFORMATIONS

MOST PHARYNGITIS-TONSILLITIS CASES are caused by a VIRUS.

Bacteria: Group A β-hemolytic streptococci (Streptococcus pyogenes) is the most frequent cause;

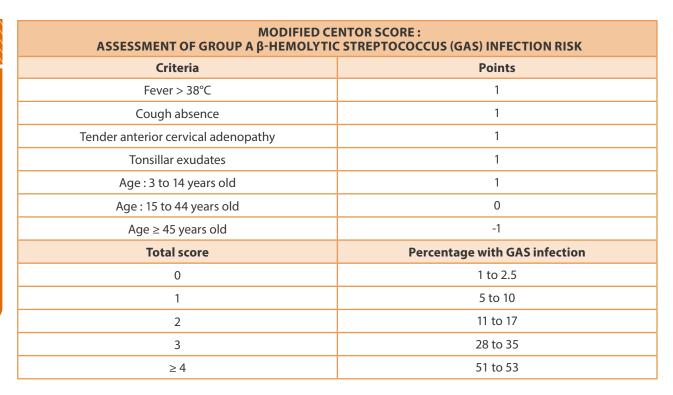

- ▶ Involves in 5 to 15 % of pharyngitis-tonsillitis in adults
- ▶ Involves in 20 to 30 % of pharyngitis-tonsillitis in children

DIAGNOSIS

	POTENTIAL INDICATORS OF				
	Group A β-hemolytic streptococcus (GAS) infection	Viral infection			
Season	Winter-spring				
Age	3 to 15 years old				
Onset	Abrupt	Gradual			
Signs and symptoms	 Tender anterior cervical adenopathy Pain on swallowing Fever Tonsils and pharynx inflammation Severe sore throat Nausea Palatal petechiae Tonsillar exudates Scarlatiniform rash Vomiting, and occasionally, abdominal pain, especially in children 	 No fever Conjonctivitis Diarrhea Hoarseness of voice Rhinorrhea Cough 			

The epidemiological context (proven contact in the past two weeks) also increases the risk of GAS infection.

- ▶ The modified Centor score is useful to identify cases with a low risk of bacterial pharyngitis-tonsillitis and to determine if a diagnostic test is needed.
- ► Even with a high score (≥ 4), the risk of having bacterial pharyngitis-tonsillitis is only 50 %.

TREATMENT PRINCIPLES

For VIRAL PHARYNGITIS: DO NOT TREAT WITH ANTIBIOTICS; the vast majority of cases clear up within 3 to 5 days. Reassess if symptoms persist.

SUPPORTIVE TREATMENTS

▶ It is important to reduce pain and fever by using an analgesic/antipyretic (acetaminophen or ibuprofen*), especially in the first few days.

*Ibuprofen is not recommended for children under 6 months of age.

Treatment should not be initiated before a positive rapid test result or a positive culture is received, unless the patient presents:

- ► Very severe symptoms
- ► Clinical signs of scarlatina
- ► Complications from their pharyngitis-tonsillitis (tonsillar abscess, bacterial adenitis, etc.)
- ► A history of acute rheumatic fever (ARF)

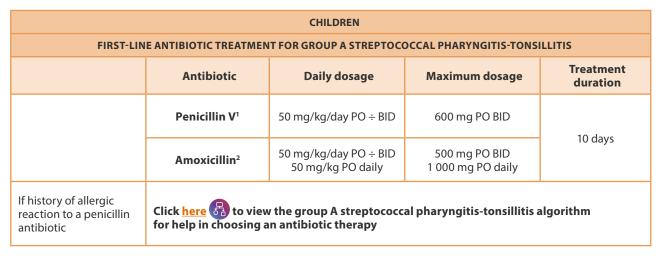

HISTORY OF ALLERGIC REACTION TO A PENICILLIN ANTIBIOTIC

- ▶ True penicillin allergy is uncommon.
 - For 100 people with a history of penicillin allergy fewer than 10 will be **CONFIRMED** to have a true diagnosis of allergy.
 - In children, the prevalence of true allergy is lower (< 6 %). Most of the reactions observed are generally non-severe delayed rashes.
- ▶ It is therefore important to carefully assess the allergy status of a patient who reports a history of allergic reaction to penicillin, before considering using alternatives to beta-lactams. For help, consult the decision-making tool in case of allergy to penicillins.

ANTIBIOTIC THERAPY

- ▶ Provides a modest reduction in symptoms duration (approximately 1 day).
- ▶ Prevent acute rheumatic fever if started within 9 days after the onset of symptoms.
- ▶ Helps reducing infection complications and person-to-person transmission.

The antibiotic treatment value has not been determined in patients coping with pharyngitis-tonsillitis caused by Group C or G streptococci. Some clinicians offer antibiotic treatment to symptomatic patients.

▶ Children can return to school or daycare after 24 hours of treatment.

ADULT							
FIRST-LINE TREATMENT FOR GROUP A STREPTOCOCCAL PHARYNGITIS-TONSILLITIS							
	Antibiotic	Daily dosage	Treatment duration				
	Penicillin V¹	600 mg PO BID	10 days				
	Amoxicillin	500 mg PO BID OR 1 000 mg PO daily					
If history of allergic reaction to a penicillin antibiotic Click here to view the group A streptococcal pharyngitis-tonsillitis algorithm for help in choosing an antibiotic therapy							

- 1. Penicillin V is still the first-choice treatment due to its effectiveness and safety.
- 2. In children, amoxicillin may be used and seems just as effective as penicillin V.

In the case where no response is observed after 48 to 72 hours of treatment and before starting second-line treatment: :

- Verify acceptability and adherence to treatment
- Reassess diagnosis

PRESCRIBE THE FOLLOWING WITH CAUTION

Penicillins

Penicillin V or Amoxicillin

The 1st dose should always be administered under medical supervision.

If history of:

- Immediate reactions, a drug provocation test should be performed;
- Delayed reactions, the patient or his/her family should be informed of the possible risk of recurrence in the days following initiation of the antibiotic.

AVOID PRESCRIBING

risk of recurrence in the days following

or

Penicillins

Penicillin V or Amoxicillin

SIMILAR cephalosporins

initiation of the antibiotic.

Cephalexin OR Cefadroxil for all other clinical situations (with the exception of adults with a recent history of nonsevere reactions or children with a history of serum sickness-like reactions3, as described above).

I IF A BETA-LACTAM7 CANNOT BE ADMINISTERED, THE FOLLOWING CAN BE PRESCRIBED...

Clarithromycin OR Azithromycin **OR Clindamycin**⁶

occur in children on antibiotic therapy are generally nonallergic and may be of viral origin.

4. Anaphylaxis without shock or intubation: requires an extra level of vigilance.

- With no recommendations concerning other beta-lactams.
- Option only in adult
- 7. Penicillins, cephalosporins and carbapenems.

For further information, see the interactive tool and the decision-making tool

AGEP: acute generalized exanthematous pustulosis;

DRESS: drug reaction with eosinophilia and systemic symptoms;

SJS: Stevens-Johnson syndrome;

TEN: toxic epidermal necrolysis.

CHILDREN

FIRST-LINE ANTIBIOTIC THERAPY FOR GROUP A STREPTOCOCCAL PHARYNGITIS-TONSILLITIS IF HISTORY OF ALLERGIC REACTION TO A PENICILLIN ANTIBIOTIC

	Antibiotic	Daily dosage	Maximum dosage	Treatment duration
	Cephalexin	50 mg/kg/day PO ÷ BID	500 mg PO BID	10 days
Beta-lactams ¹ recommended, according to the	Penicillin V	50 mg/kg/day PO ÷ BID	600 mg PO BID	
clinical judgement support algorithm	Amoxicillin	50 mg/kg/day PO ÷ BID OR 50 mg/kg PO daily	500 mg PO BID OR 1 000 mg PO daily	
Alternative if	Clarithromycin	15 mg/kg/day PO ÷ BID	250 mg PO BID	10 days
a beta-lactam¹ cannot be administered	Azithromycin	12 mg/kg PO daily	500 mg PO daily	5 days

ADULT

FIRST-LINE ANTIBIOTIC THERAPY FOR GROUP A STREPTOCOCCAL PHARYNGITIS-TONSILLITIS IF HISTORY OF ALLERGIC REACTION TO A PENICILLIN ANTIBIOTIC

	Antibiotic	Daily dosage	Treatment duration	
	Cefadroxil	1 000 mg PO daily		
Beta-lactams ¹ recommended,	Cephalexin	n 500 mg PO BID		
according to the clinical judgement support algorithm	Penicillin V	600 mg PO BID	10 days	
	Amoxicillin	500 mg PO BID OR 1 000 mg PO daily		
	Clarithromycin	250 mg PO BID	10 days	
Alternative if a beta-lactam ¹ cannot be administered	Azithromycin	500 mg PO daily on day 1, then 250 mg PO daily from days 2 to 5	5 days	
	Clindamycin	300 mg PO TID	10 days	

^{1.} Penicillins, cephalosporins and carbapenems.

[•] Use only if the cautious administration of a penicillin antibiotic is the option chosen.
